Judgement

AI ratings make people more suspicious

AI experts ✕

4.5

Trust in own decision

✕ AI experts

People trust their own decision least if they validate AI

Acceptability of Artificial Intelligence to automate identification of suspects and criminal material

B. Writers living in both Free and Not Free countries have curtailed or avoided activities on social media, or seriously considered it, due to fear of government surveillance, including:

42% of writers in Free countries

46% of writers in Partly Free countries

53% of writers in Not Free countries

Users Are Concerned About Apps and Personal Information

% of app downloaders who chose to do the following after discovering how much personal information the app required

Source: Pew Research Center Surveys, Jan. 27, 2015 to Feb. 16, 2015. N=461. Adults Ages 18+. The margin of error for all adults is +/- 5.8 percentage points.

PEW RESEARCH CENTER

Unintended consequences:
Security measures make
citizens feel unsafe

Felt need to protect personal data

Observations ... for discussion

- AI leads to higher ratings of suspicion
- Lower confidence in AI judgements of 'no suspicion'
- Lower trust in own judgements when rating AI
- EXCEPT when people are AI experts: here we see extreme trust in AI judgements and own judgements
- Acceptability of AI for security purposes – generally high, with variations across countries, and generally lower for citizens than professionals
- Counter-moves of citizens from modifications to falsification to exit
